Smart restaurant is an idea to realize the automation in restaurants. People are very much keen to move towards a smarter universe with the implementation of smart city, smart room, smart world. In this project we are above to propose a smart restaurant that will be more logical process with the help of smart technology. Here the customer can order their food through the touch display and the information is transferred to the kitchen section and the chef will prepares food. This reduces the waiting time and confusion between the waiters. There will be automatic banking system which will be provided for bill payment using debit card. The order for the customer is served by first come first service basis. The smart restaurant system is more attractive for customer and easy to use.
