This project proposal gives way to monitor and control environment parameters to be viewed from anyplace of the world. Technology deployed in this paper is Internet of Things (IoT) that is beneficial and efficient way to communicate with the hardware through internet. This system data logger monitors and control environmental parameter such as temperature, humidity and light intensity using sensors. These collected data's from the sensors are sending to webserver via Wi-Fi. The sensors information are plotted as a graph web server and database is has a past information's and maintains records for future analysis.
